Structural sensitivity of the target field
(a) Target blur: valley then reversal
(not monotonic, see panel c)
BPD relative to own baseline
blur sigma (pixels)
(b) Block-shuffle: strong, near-universal response
(0/60 negative at every level)
BPD relative to own baseline
shuffle block size (pixels)
(c) Blur phases, with 95% CI
(the valley shape, statistically)
mild (sigma=1)
moderate (sigma=4)
plateau (sigma=8)
strong (sigma=16)
aggressive (sigma=32)
mean BPD relative to baseline
(d) Wetter fields lose more to aggressive blur
(exploratory, n=20, rho=0.61, no CI)
BPD delta at aggressive blur (sigma=32)
wet fraction (true field)
